

P-1 (1+1+1) H/10

2010

CHEMISTRY (Honours)

FIRST PAPER

Full Marks : 90

Time : Four Hours

The figures in the margin indicate full marks.

Group - A

(Organic Chemistry)

Answer any three questions.

1. Explain the following facts (any four) . (4×2) = 10
- (a) Monochloro acetic acid is stronger acid than acetic acid.
 - (b) *p*-Nitroaniline is less basic than aniline.
 - (c) The gauche conformation of cis-2,3-dial is more stable than the anti form.
 - (d) Toluene chiefly gives *o*- and *p*- products on nitration.
 - (e) The distance between the end carbons of *n*-butane is less than the three times of C-C single bond.
2. (a) Designate the chiral centres of the following compounds as R/S-rotation by mentioning the priority order of the ligands attached to the chiral centres. (1+1=2)
S.T.O.

2/1/19

2. (2)

(c) Designate the following compounds as *Z/E* isomers (you must mention the priority order of the groups): (1+1=2)

(c) Designate the following compounds by *D/L* isomers: (1+1=2)

(3)

(d) Predict the product/products with proper stereochemical notations (i.e., by *R/S* notation): (2+2=4)

3. (a) Which one is more stable in the following pairs? Give reasons. (2+3+5)

(ii) 1-Butene and 2-butene

(iii) Addition of chlorine to an alkene is less stereospecific than the addition of bromine. Explain. (3)

(c) Predict the product with mechanism: (2)

P.T.O.

13/26

4. (a) Cyclopentadienyl anion is an aromatic species. 3
 Explain. 3

(b) Benzene and dimerized benzene ($C_{10}H_8$)
 are aromatic with the same rate through C-D bond as
 get than C-H bond. Explain. 3½

(c) Give interpretation of the fact that phenol
 gives rapid nitration with dilute HNO_3 . 3½

Group - B

(Inorganic)

Answer any three questions.

5. (a) Atomic radii is difficult to define—Explain. 2

(b) The 1st I.P. of Cl is greater than that of K
 although both have almost similar radii—Explain. 2

(c) Deduce the ground state term symbol of nitrogen. 2

(d) Calculate the ionization energy for hydrogen atom
 using the Balmer equation. 2

(e) Mulliken scale of electronegativity is more rational
 than any other scale—Explain. 2

6. (a) Mention the principal features of H-spectrum. 4

(b) How molecular geometry can be predicted from
 concept of hybridisation? 3

(c) Discuss the factors which affect the value of
 electropositivity. 3

7. (a) Describe Slater's rule for determining effective
 nuclear charge for an electron in an atom. What are the
 limitations? 4

(b) Calculate lattice energy of NaCl from the
 following data:

$$d = 2.81 \times 10^{-8} \text{ cm} = 2.8 \text{ \AA}; \quad e = 9 \times 10^9 \text{ C}^2 \text{ mol}^{-2} \text{ cm}^{-1}$$

$$r = 4.8 \times 10^{-10} \text{ cm} \quad 2$$

(c) Explain why NaCl is more ionic than $CaCl_2$? 2

8. (a) Using VSEPR theory predict the structure of
 CO_2 , NO_2^+ and NO_2^- . 3

(b) The melting point of MgO and NaF are 2850°C
 and 988°C respectively—Explain. 3

(c) Explain the term "formal charge".

(d) What is inert pair effect?

(e) Covalent radii do not increase regularly from
 Li to H —Explain.

Group - C

(Physical Chemistry)

Answer any three questions.

9. (a) What is the physical significance of 'a' and 'b'
 in the van der Waals' equation? 3.5

(b) Comment on the nature of the gas whose n of state for a mole is

(i) $P(V - b) = RT$ and

(ii) $\left(P + \frac{a}{V^2}\right)V = RT$, with respect to a plot of compressibility factor vs pressure and attractive or repulsive forces between the molecules. 2+2

(c) The temperature of a gas is to be lowered below a critical value before it can be liquified— Explain 3

(a) What do you mean by the term viscosity and α coefficient of a fluid? 3

(b) Establish the relation $\eta = \frac{1}{3} \rho \lambda c$, where the η their units/ significance. 3

(c) Derive Clausius-Clapeyron equation and discuss its application. 4

Write short notes on : 5×2=10

(i) Second law of thermodynamics

(ii) Joule Thomson coefficient and its variation with temperature for different real gases

(a) If a gas of molecular weight 80 contained in a π of fixed volume of 1m^3 at a temperature of 300K pressure of 1 atm on its wall of area 1m^2 what will

(b) density measure if the gas is replaced by a equal weight of another gas of molecular weight 60? 3

(c) Calculate the mean free path of N_2 at 1atm pressure. 3

(d) Derive Gibbs Helmholtz equation 4

2010

CHEMISTRY (Honours)

THEORY PAPER

Full Marks : 60

Time : Four Hours

The figures in the margin indicate full marks

Answer Q. No. 1 and any five from the rest

1. Explain why ? (any four). 4 × 2½ = 10

(a) Aryl diazonium salts are more stable than alkyl diazonium salts.

(b) The migrating group retains its configuration in Hofmann degradation.

(c) With aqueous bromine solution, 2, 4, 6-trinitrophenol but not $\text{C}_6\text{H}_5\text{OH}$ or m -nitrophenol gives only 4-bromophenol.

(d) Diazomethane is more acidic than diazomethane.

(e) The reaction rate of MeI with Ag^+ at 30°C is increased by 4.5×10^4 fold on transfer from methanol to dimethyl formamide as solvents.2. (a) What is abnormal Grignard reaction? Illustrate your answer with suitable example. How the abnormal reaction can be avoided? 5

P.T.O.

(ii) Indicate the products obtained in the following cases.

(iv) What do you understand by multiplicity? How does it differ from capacity?

3. (a) Why meso-2,3-dibromosuccinic acid reacts with KOH more readily than does a *d*- or *l*-form? What are respective alkenes formed?

(b) The anti-group to the γ -halogen group always takes up β -electron from adjacent C-Br bond with suitable π bond.

(c) Acylation of anisole with acetyl chloride is speeded by pyridine. Explain the divergence. (Cyanide) reagent.

4. Give chemical evidence in support of the following (2 $\frac{1}{2}$ x 4) = 10

- (a) Hydride ion transfer in Meerwein-Ponndorf and Verley reduction.
- (b) Intermolecular nature of Cannizzaro reaction.
- (c) Dichloro Carbene is involved in Reimer-Tiemann reaction.
- (d) Reversibility of benzoin condensation.

1. (iv) Account for the fact that in dimethyl sulfoxide the order of activity of halide ion with methyl bromide is $(\text{I}^- > \text{Br}^- > \text{Cl}^-)$ which is opposite to that observed in methanolic solution.

(b) Increasing solvent polarity cause a large decrease in the rate of SN^2 attack by OH^- on Dimethyl sulphoxide ion $\text{CH}_3\text{S}^- + \text{Me}_2\text{S} \rightarrow \text{Me}_2\text{SO} + \text{Me}_2\text{S}^-$. Explain why?

(c) Treatment of EtI with aqueous alkali gives EtOH but treatment with ethanolic alkali gives ethene. Explain.

(d) Arrange the following ions in increasing order of nucleophilicity.

6. Predict the products with suitable mechanism:

7. Write short notes on:

4+3=3

- Hofmann and Saytzeff rule of β -elimination reaction.
- UCCB mechanism.
- Michael Reaction or Marriest reaction.

8. Give the preparation of the following compounds (2 $\frac{1}{2}$ \times 4) = 10

- Cyclopentane to Cyclohexanone.
- Aniline to Chloroacetyllic.
- Acetaldehyde to acetone using 1,3-dithian as intermediate.
- Methylamine to δ -azetidinone.
- Acetic acid to acetone using organo lithium compound.
- Phenol to *p*-hydroxyacetophenone.
- Nitrobenzene to *m*-nitroaniline.

9. (a) Write down the important use of the following reagents in organic chemistry.

(b) Draw the following conversions as a single mechanism with proper reaction.

(c) Give one method of converting a secondary alcohol to a hydrocarbon.

10. (a) For a given substrate, chlorination is favored with respect to substitution by rate in terms of rate. Explain.

(b) Acid catalysed bromination of 2-butanone give 3-bromoacetophenone whereas base catalysed bromination give 4-bromoacetophenone. Explain.

(c) With acetone, di and tri-bromination in the presence of NaOH takes place on the same carbon atom. Explain why?

(d) What are Wittig reagent? How are they prepared? Discuss the mechanism.

2010

CHEMISTRY (Honours)

SOLVED PAPER

Total Marks: 60

Time: Four hours

The figures in the margin indicate the marks.

Answer Q. No. 1 and any five from the rest.

1. Answer any five questions. (2×5=10)

(a) Why packing fraction may be positive or negative whereas mass defect are not?

(b) What happens when NH_3 gas is passed through Nessler's reagent?(c) PH_3 oxidises but PH_3 does not oxidise. Explain.

(d) Explain why alkali metals are soft.

(e) Group 6 metals are less reactive compared to alkali metals. Explain why?

(f) Triethylamine forms addition compound with $B(CH_3)_3$ but triethylamine does not. Explain.

2. (a) Explain the working principle of G.M. counter. 5

(b) What is spallation reaction? How does it differ from fission? 4

(c) What are Fermi and Fermi potentials? 2

T.T.O.

3. (a) Discuss the working principle of Balmer's cathode ray spectrum. 5
- (b) Write notes on application of radioactivity. 5
4. (a) Discuss a p ratio for stability of nucleus. 3
- (b) How would you show that two Ca atoms in PCl_5 occupy different positions than the other three. (Atom 7) 2
- (c) In an old Egyptian mummy C^{14} was found a 50% of the human body. Calculate how many years the man had died ($t_{1/2}$ of $C^{14} = 5730$ yrs). 5
5. (a) Give a comparative account of s-p block metals respect to their electronic configurations, oxidation state, max. valence state and oxides. 5
- (b) Diamodic acid is not a member of group 16. Explain. 3
- (c) Alkali metals were dissolved in aq. NH_3 give a conducting solution—Explain. 3
6. (a) Show with the help of redox reaction sulphur (IV) two S atoms in $S_2O_4^{2-}$ are not equivalent. 3
- (b) Explain with appropriate examples, the concept of acids and bases. 3
- (c) Urea can act both as acid as well as base—cite examples. 2
- (d) Why is BF_3 a better Lewis acid than BF_4^- ? 2

7. (a) Redox potentials of group V halides are as follows: NO_2^+ / NO_2 , IO_3^- / IO_2 , SO_3^2- / SO_2 . Explain. 3
- (b) Reactivity of halogen oxides from Cl_2O to I_2O_5 . Explain. 3
- (c) Mercury differs from Zn and Cd in the same group. Why? 4
8. (a) Discuss the possibility of main carbon dating. 4
- (b) Aluminium carbonate exists as $Al_2(OH)_2CO_3$. Does carbonate exist as anion. Explain. 3
- (c) Explain why silver is not a graphite like structure. 3
9. Write notes on any two of the following: 2 (2 × 1)
- (a) Coarsening of nucleus.
- (b) Components of matter.
- (c) Basic properties of lattice.
- (d) Modern Theory of nuclear forces.

2010

CHEMISTRY [Honours]

Fifth Paper

Full Marks : 40

Time : Four Hours

The figures in the margin indicate full marks

Answer any six questions.

1. Answer any five questions. 2×5=10

- (a) In a solution of low conductance, the platinum electrodes are kept closer and the area of the electrodes is kept larger during conductance measurement. Why?
- (b) On dilution the equivalent conductance increases but the specific conductance decreases. — Explain.
- (c) The degree of hydrolysis of a salt of a weak acid and a weak base is independent of concentration. — Explain.
- (d) Quinhydrone electrode is not suitable for pH measurement in strongly alkaline solution. — Why?
- (e) Ionic product and dissociation constant of water are not identical. Account for.
- (f) Water wets glass, but mercury does not. — Why?

P. T. O.

- (g) The neutralisation of all bases by acids do not necessarily occur at pH 7.0—Explain. 1
- (h) H^+ and OH^- ions in aqueous media have exceptionally high ionic conductance—Explain. 1
2. (a) Arrange the following electrolytes in order of ionic conductance: $NaOH$, $NaCl$, CH_3COOH —all at same concentration. Will there be any change in order of ionic conductance at infinite dilution? $1\frac{1}{2}$ —1—2 $\frac{1}{2}$
- (b) Discuss how conductance measurement may be used for the determination of solubility of a sparingly soluble salt. 3
- (c) The specific conductivity of a saturated solution of $AgCl$ is $1.55 \times 10^{-6} \text{ ohm}^{-1} \text{ cm}^{-1}$. The mobilities of Cl^- and Ag^+ ions are 5.6×10^{-4} and $6.8 \times 10^{-4} \text{ cm}^2 \text{ sec}^{-1}$ respectively under unit potential gradient. Calculate the solubility product of $AgCl$. 2 $\frac{1}{2}$
- (d) Explain the nature of conductometric titrations for CH_3COOH vs. $NaOH$. 2
3. (a) Arrange the following aqueous solution of same molar concentration in order of increasing osmotic pressure: (i) KCl , (ii) glucose, (iii) $Ba(NO_3)_2$, (iv) Urea, (v) potassium ferri-cyanide. 2 $\frac{1}{2}$
- (b) Show that the relative lowering of vapour pressure is a colligative property. 2

- (c) How will you determine the molecular mass of a non-volatile substance by the study of the relative lowering of vapour pressure of the solution? 2 $\frac{1}{2}$
- (d) Find the boiling and freezing points of a solution containing 9.52 g of glucose dissolved in 50.5 g of water. For water, $K_b = 1.86$ and $K_f = 1.86$. 3
1. (a) Derive an expression for the equilibrium constant of a chemical reaction from thermodynamic considerations. 3
- (b) The heat of a reaction can be determined from the measurement of the equilibrium constant of this reaction as a function of temperature—Justify. 3
- (c) When an alcohol and acetic acid are mixed together in equimolar proportions, 66.5 per cent are converted into ester, calculate the equilibrium constant. 3
- (d) How much of the ester will be formed if 1 mole of acetic acid is mixed with 0.5 mole of the alcohol? 3
- (e) Describe briefly how would you determine the pH of a solution using a glass electrode. 3
- (f) What are the advantages and disadvantages of semi-permeable membrane? 2
- (g) "Activity coefficients of ions can be determined by various measurements." Discuss. 2
- (h) Calculate the EMF of the cell in which the reaction is

5. $Mg(s) + 2Ag^+(aq) \rightarrow Mg^{2+}(aq) + 2Ag(s)$
 in $[Mg^{2+}] = 0.130 M$ and $[Ag^+] = 1 \times 10^{-3} M$ at 298 K.
 or.

$E^\circ_{Ag^+/Ag} = +0.80 V$ and $E^\circ_{Mg^{2+}/Mg} = -2.34 V$
 at 298K.

6. (a) Distinguish between surface tension and surface energy. Under what condition they are identical? 2

(b) What is meant by 'specific refraction' and 'molar refraction' of a substance? How do you experimentally measure the refractive index of a solid substance? 3

(c) Temperature has different effects on viscosities of liquids and gases. Explain. 2½

(d) Para-dichlorobenzene is non-polar but additive viscosity has a dipole moment of 1.64 Debye. Explain. 2½

7. (a) Explain the terms - eutectic point, eutectic composition, congruent melting and incongruent melting. 4

(b) What are neutralisation indicators? Explain their working and selection giving suitable examples. 2+2

(c) State and explain the law which governs the distribution of solute between two immiscible solvents. 2

8. (a) pH-scale lies between 0 and 14. Can the pH of a solution have a value greater than 14 or less than zero? 2

(b) Calculate the pH of a 0.01 M solution of CH_3COOH given that $K_a = 1 \times 10^{-4}$ and $K_b = 1 \times 10^{-5}$. 2

(c) The reaction in a fuel cell is

$$E^\circ(O_2/H^+, H_2O) = 1.22 V$$

Calculate maximum amount of electrical work available per mole of hydrogen. 3

(d) Construct the cells for which the cell reactions

9. Write notes on in short (any four): 2½ x 4 = 10

(i) Conduction effect

(ii) Parachor

(iii) Abnormal Colligative properties.

(iv) Le-Chatelier Principle.

(v) Van't Hoff equation

(vi) Buffer capacity.

2010
B (Three Year H)
Under 1-1-1 System

2010

CHEMISTRY (Honours)

FIRST PAPER

(Revised New Syllabus)

Time : 1 hour **Full Marks** : 90

The figures in the margin indicate full marks.

Answer **three** questions from each Group.

GROUP—A

(Organic)

1. Explain the following 2×3=10

- (a) The addition of bromine to ethylene double bond is non-stereospecific whereas addition of bromine to double bond is *trans*.
- (b) Acrylic acid is stronger than propenoic acid.
- (c) C_2-C_3 bond length in propene is shorter than $C-C$ bond in propane.

MS-100/34

(Turn Over)

27

1. The most reactive alkyl halide that readily undergoes SN2 reaction is
2. 1,2-Dibromocyclohexane has two chiral centers. How many stereoisomers does it have (consider all isomers)

3. a) Draw the Newman projection of ethane along the C-C bond. b) Indicate the σ bonds below

4. Explain why polymers do not react with H_2 while C_2 does. Comment on C_2 .
5. What does the structure of C_2 look like?
6. Draw the structural formula of
 a) 2-Fluoro-1-hydroxypropane
 b) 2,3-Dibromo-2-butene
7. Arrange the following in decreasing order of reactivity with OH^- .

IR: 58/34

Molecular

Date: 04/34

Class: 2011

28

8. a) How many lone pairs are there in SO_2 ?
 b) How many lone pairs are there in SO_3 ?
 c) How many lone pairs are there in SO_4^{2-} ?
 d) How many lone pairs are there in SO_3^{2-} ?
 e) How many lone pairs are there in SO_3^{+} ?
 f) How many lone pairs are there in SO_3^{-} ?
 g) How many lone pairs are there in SO_3^{+} ?
 h) How many lone pairs are there in SO_3^{-} ?
 i) How many lone pairs are there in SO_3^{+} ?
 j) How many lone pairs are there in SO_3^{-} ?

9. a) Identify A, B and C.
 b) $\text{C}_6\text{H}_5\text{CH}_2\text{Cl} \xrightarrow{\text{KOH}} \text{A} \xrightarrow{\text{KOH}} \text{B} \xrightarrow{\text{KOH}} \text{C}$
 c) $\text{C}_6\text{H}_5\text{CH}_2\text{Cl} \xrightarrow{\text{KOH}} \text{A} \xrightarrow{\text{KOH}} \text{B} \xrightarrow{\text{KOH}} \text{C}$

10. a) The Arrhenius acid is expected to be stronger on the basis of electron count. But none of the answers possible is acidic in nature. Explain the fact.
 b) Are the following molecules optically active? Explain your answer.

GROUP B
[Inorganic]

5. (a) What are the four quantum numbers? Explain the significance of these numbers in relation to atomic structure. (1-1-2)
- (b) Determine the ground state term symbol for d^2 electronic state. (1-1-2)
- (c) Calculate the values of L^2 in its first excited state. (1-1-2)
- (d) Mention the significance for the negative sign in the energy expression of an electron in hydrogen like electronic systems. (1-1-2)
6. (a) Using VSEPR theory, explain the geometry of the following species : (1-2-1)
- (i) CO_2
- (ii) ClF_3
- (b) Calculate formal charges on the different atoms of the ions. (1-2-1)
- (i) CO_3^{2-}
- (ii) NO_2^+
- (c) Discuss Slater's rule for determining effective nuclear charge. (1-2-1)

- 6b) Draw the shape of PF_5 molecule and mention the hybridization of the central atom in this molecule. (1-1-2)
7. (a) When valence electrons enter the d -orbital before going to the nd -orbitals but when a transition metal ionizes, the d -electrons are removed first. Why? (2-1)
- (b) Give and explain Hund's rule to explain covalent character in ionic compounds. (2-1)
- (c) Differentiate between electron affinity and electronegativity. Also mention their periodic variation. (1-1-3)
- (d) Why are van der Waals radii generally higher than covalent radii? Explain. (2)
8. (a) Write short notes on : (1-2-1-5)
- (i) Diagonal relationship
- (ii) Pauli's exclusion principle
- (b) Both of the nd -orbitals (nd_{xy} and nd_{z^2}) contain and the relative non-covalent character should be taken into account when considering the structure of bonding compounds. Explain with an example. (2)
- (c) What are f -block elements? Mention their position in the periodic table and contrast them. (1-1-2)

GROUP-C

[Physical]

9. (a) What is the nature and significance of van der Waals' constants a and b ?
- (b) What do you understand by law of corresponding states? Obtain the reduced equation of state for a gas obeying van der Waals' equation. [2+1]
- (c) Explain the term collision frequency. On what factor does it depend? [2+1]
10. (a) What is meant by degrees of freedom?
- (b) Calculate the degrees of freedom for CO_2 and C_2H_2 .
- (c) Derive the barometric formula $p = p_0 e^{-Mgh/RT}$.
- (d) Show that the height at which the atmospheric pressure is reduced to half its value is given by $h = 0.6909 RT / Mg$.
11. (a) What are the limitations of the first law of thermodynamics? State the second law of thermodynamics. [1+2]
- (b) 10 moles of Helium are heated from $0^\circ C$ to $100^\circ C$ at constant pressure of 1 atm. Calculate ΔS .

Derive the relationship $\gamma = \frac{C_p}{C_v} = \frac{df+2}{df}$.

What do you understand by inversion temperature? Why do He and H₂ show Inverting instead of cooling? [2+1+1+1]

12. (a) Calculate the efficiency of a Carnot cycle, engine working between $100^\circ K$ and $800^\circ K$. Calculate the maximum work obtained in getting a fire engine does the task of 1 km from rest. [1]
- (b) Show that entropy of mixing is always positive for gases or substances. What is total entropy? [2+1]
- (c) State and explain third law of thermodynamics. [2]

2010

CHEMISTRY (Honours)

THIRD PAPER

(Revised New Syllabus)

Time : 1 hour **Full Marks : 50**

The questions in the margin indicate full marks

Section - I (out of 20) : Answer any five from the list

1. Explain any five of the following five **(10×2=20)**

- (a) An alcohol can be distinguished from a primary amine by using litmus test.
- (b) Tert-butyl chloride does not form a stable carbocation whereas with $\text{CH}_3\text{CH}_2\text{CH}_2\text{Cl}$ forms secondary carbocation.
- (c) β -propiolactone is not cyclic decarboxylate on heating.
- (d) $\text{Mn}(\text{OHNO}_2)_2$ gives a precipitate with chloride silver nitrate but $\text{Mn}(\text{OHNO}_2)_2$ does not.
- (e) The bond strength of $\text{C}=\text{C}$ is less than twice that of $\text{C}-\text{C}$ bond.

Mark : 10×2=20

(Turn Over)

5. Si_4 type of reactions are extremely uncommon in the gts phase.
2. (a) Give example with explanation of the following :
- Compound heated up but solid centre but cannot specify reaction.
 - Compound heated up but then one solid centre but does not show any specific reaction.
- (b) What difference do you have to be observed in the chlorination of $\text{CH}_3\text{CH}_2\text{Br}$ and $\text{BrCH}_2\text{CH}_2\text{Br}$? Give an example showing type?
3. (a) Why is potassium perchlorate often used to promote S_2 reactions?
- (b) Give the structure of the major products of the following reaction and explain.
- $$\text{Cinnabryl} + \text{H}_2\text{SO}_4 \rightarrow \text{Cinnabryl} + \text{H}_2\text{O}$$
- (c) Write a note on the following reaction mechanism.
4. (a) An organic compound $\text{C}_8\text{H}_{10}\text{O}_2$ is readily oxidised by KMnO_4 to give compound $\text{C}_8\text{H}_8\text{O}_4$ which gives a red colour on compound $\text{C}_8\text{H}_8\text{O}_4$ being oxidised to $\text{C}_8\text{H}_6\text{O}_6$.

- (b) Two compounds identified as 2,4-dinitrophenylhydrazones and 2,4-dinitrophenylhydrazones are identified and explain the formation of different compounds mentioned.
- (c) Benzene ring reacts with HNO_3 in a slightly acidic medium to give C-nitro compound whereas benzene ring reacts with HNO_3 in a slightly basic medium to yield N-nitro compound. Why?
- (d) Which of the following would be most and least readily hydrolysed with NaOH and why?
- $$\text{MeCOOMe}, \text{MeCOOEt}, \text{MeCOO}i\text{Pr}, \text{MeCOO}n\text{Bu}$$
- (e) Write short notes on any **three** of the following. (3×3=10)
- Solubility.
 - Electrochromism.
 - Pyrolytic reaction.
 - Quinone structure.
- (f) Give evidence to establish that in the benzene ring migration of the group can to the same hydroxyl group migrate.

3. Why do you fail to prepare a ketone from acetylene by Grignard reagent? How do you prepare a ketone of substituted alkyne?
4. How do you do the reaction of alkyl of the following cases?
- Nucleophilic and electrophilic
 - Nucleophilic and electrophilic
7. 4. Give three suitable products of reaction of H_2 and H_2O .
- Isone reacts as an efficient leaving group as well as an efficient nucleophile. Explain.
 - What is nucleophilic substitution? Explain with an example.
 - Alkyl halide forms a stable group, but whereas transition state fails to do so. Explain.
8. a) i) What is nucleophilic substitution?
ii) Between two acids which one will coordinate easily? Explain your answer.

2-1-2020

9. Give evidence in favor of the statement "Transition state of reaction involves intermediate state of reactant".
10. Give a suitable reason to get the following reaction to be a $\text{S}_{\text{N}}2$ reaction.
11. Explain the products C, D, and E with suitable mechanism.

12. Explain the following transformations.
- $\text{C}_6\text{H}_5\text{CH}_2\text{Br} \xrightarrow{\text{NaOH}} \text{C}_6\text{H}_5\text{CH}_2\text{OH}$
 - $\text{C}_6\text{H}_5\text{CH}_2\text{Br} \xrightarrow{\text{NaOH}} \text{C}_6\text{H}_5\text{CH}=\text{CH}_2$
13. Explain the following reactions in which the product is not the expected one and give the reason for the same. Illustrate.

of Ag^+ and two equivalents of bromine yields $\text{BF} \cdot \text{C}_6\text{H}_4\text{OBr}_2$ which on treatment with caustic soda followed by hydrolysis affords a compound A ($\text{C}_6\text{H}_6\text{O}$). The other bromide BF_2 on treatment with Na_2CO_3 gives a compound B . What are A , BF and BF_2 Give the reaction of formation of A from BF .

10. Three compounds A , B and C are carbon molecules formula $\text{C}_4\text{H}_8\text{O}$. On oxidation with hot alkali KMnO_4 , A gives $\text{C}_2\text{H}_4\text{O}$, B and C remain unchanged. Treatment with hot conc. HNO_3 gives $\text{C}_2\text{H}_4\text{O}$, B and C give $\text{C}_2\text{H}_4\text{O}$ and C gives $\text{C}_2\text{H}_4\text{O}$ and $\text{C}_2\text{H}_4\text{O}$. A also reacts with H_2 to give C_4H_{10} . B and C give C_4H_{10} and $\text{C}_2\text{H}_4\text{O}$ when reacted with H_2 . Identify A , B and C and mention your mode of approach.
11. Describe the use of H_2S , HNO_2 and PbO_2 in organic systems. (10M) (10)

2010

CHEMISTRY (Honours)

SEM KTH PAPER

4 Revised New Syllabus

Time: 1 hour

Total Marks: 60

The questions in the margin indicate full marks.

Answer questions No. 1 and any five from the rest.

Answer any five

(25M)

1. (a) Li and Ca elements generally undergo ionic bond while heavier elements undergo covalent reaction.
- (b) BF_3 exhibits two half bonds.
- (c) NH_3 is pyramidal, but BF_3 is planar.
- (d) AgCl dissolves in NH_3 solution while AgI does not.
2. H_2SO_4 , H_3PO_4 and H_2SiO_4 are mono-, di- and tri-basic acids respectively.
3. Give the value of K_{sp} when AgCl and AgI are in contact.

2. (a) Give a brief account on GZ counter.
 (b) Discuss the principle of Thomson method of determination of the ratio of electron and positive rays.
3. (a) Discuss the principle of radiocarbon dating.
 (b) What are Gersonium-Radium reactions?
 (c) Positron is used to trigger a fusion reaction. Justify.
 (d) What is the principle of breeder reactors? 3-3-2
4. (a) Spontaneous fission is always accompanied by fission. Explain.
 (b) Write short notes on
 (i) Nuclear reaction cross section
 (ii) Nuclear forces
 (c) The binding energy per nucleon for ^{235}U is 7.60 MeV and that for ^{137}I is 7.47 MeV. Calculate the energy required to remove a neutron from ^{235}U . 3-12-2
5. (a) How can the substituents be used to study the mechanism of esterification reaction?

- (b) What is nuclear binding energy and how is it related to nuclear stability?
 (c) Fluorine is a natural radioactive element whereas hydrogen is inactive. Explain. 1-1-2
- (a) Compare the chemistry of Zn, Cd and Hg with respect to its co-ordination complex formation.
 (b) Give a comparative discussion on the properties of hydrides of N, P, As, Sb and Bi. 5-5
- (a) Give reasons why PF_5 is known but NF_5 is not.
 (b) Give a method of preparation of NH_4SCN and mention its uses.
 (c) In Marsh's test SnCl_2 gives metallic mirror before the Evans solution AsH_3 gives the mirror after the Evans. Explain.
 (d) Freons deplete ozone layer of the atmosphere. Explain. 3-1-2-3
- (a) Give evidence for I^- and I^{3-} .
 (b) Fluorides may be oxidised electrochemically but not chemically. Explain.

9. (a) NO_2 readily dimerises while NO does not. Explain.
- (b) Solutions of dichromates in liquid ammonia are blue coloured and reducing in nature. Explain.
10. (a) SF_6 is unreactive towards H_2O while TeF_6 reacts. Explain.
- (b) Coinage metals are less reactive than alkaline metals. Explain.
- (c) Classify the following as hard/soft acids/bases :
 BF_3 , Ni^{2+} , I^- , CH_3COO^-
- (d) Which of the following reactions is expected to proceed towards right according to HSAB concept?
 (i) $\text{CH}_3\text{Mg} + \text{HCl} \rightarrow \text{CH}_3\text{MgCl} + \text{H}$
 (ii) $[\text{AgCl}_2]_{\text{aq}} + \text{CN}^-_{\text{aq}} \rightleftharpoons [\text{Ag}(\text{CN})_2]_{\text{aq}} + \text{Cl}^-_{\text{aq}}$
11. Write short notes on
 (a) Phosphanes
 (b) Sarcosis
 (c) Dicyanides

2010

CHEMISTRY (Honours)

FIFTH PAPER

[Revised New Syllabus]

4 Hours

Full Marks - 60

The figures in the margin indicate full marks

Answer Question No. 1 and any five from the rest.

1. Answer any five questions

(20 x 10)

- (a) Chemical equilibrium is dynamic in nature. How?
- (b) Addition of NaCl to water has hardly found the osmotic pressure expected. Why?
- (c) Crystalline electrode is not suitable to get measurements of strong alkali solution. Explain.
- (d) What do you mean by amphiphiles?
- (e) What do you mean by 'Reynolds' number'?

1. (a) Whether gas and what that surface tension or not. Comment.
- (b) Transport number of an ion sometimes gives a negative value. Explain.
2. (a) What is meant by reaction quotient? Derive an expression for the reaction quotient. What is the significance of the quotient?
- (b) What is reversible and irreversible reaction? Give examples.
- (c) Assuming that the degree of dissociation of HCl at a certain temperature and under atmospheric pressure is 0.2, calculate the pressure at which this substance will be half dissociated at the same temperature.
3. (a) What will be the pH of 10^{-3}M HCl ?
- (b) What is meant by buffer capacity? Show that the buffer capacity of a solution of weak acid and its salt is maximum when their concentrations are equal.
- (c) Calculate the pH of a 0.1 molar solution of ammonia in water and find pOH (molar solution of ammonium hydroxide in water at 298 K, K_a of NH_4^+ is 1.8×10^{-5}).

- (d) Define transference number. How are transference numbers determined by 'Moving Boundary' method? 4
- (e) Write down Kohlrausch's law of independent migration. How can one determine the equivalent conductance of NaCl and an infinite dilution using the law? 3
- (f) At 25°C the resistance of 0.1% KCl in a conductivity cell is 86.8 ohms and that of 0.5% NaCl is 203 ohms. What is the specific conductance and equivalent conductance of 0.05% NaCl ? (Specific conductance of 0.1% KCl is $9.1 \times 10^{-5} \text{ ohm}^{-1} \text{ cm}^{-1}$.) 1
- (g) Define coefficients of surface tension and viscosity of a liquid with units. 2
- (h) A soap bubble rises 1.0 cm in a capillary tube of radius 0.3412 mm. Calculate the surface tension of soap if the density of soap is 2000 kg m^{-3} . 4
- (i) Explain why viscosity of a gas increases with temperature. 1
- (j) Define the terms phase, component and degree of freedom of a system. 3

6. Discuss the application of phase rule in water system with phase diagram.
7. Derive the phase rule introduction in Gibbs.
7. (a) What are colligative properties?
- (b) Derive an expression for the normal freezing point depression constant of the solution in terms of enthalpy of fusion.
8. A solution of 1×10^{-4} g of compound $C_{12}H_{10}O_2$ in 25×10^{-3} kg in chloroform boils at 331.1 K. Boiling point of chloroform is 334 K. Calculate ΔH_{vap} and K_f for chloroform.
8. (a) What is the basic difference between electrochemical potential and chemical potential?
- (b) Construct a cell where the following reaction takes place :
- $$2KMnO_4 + 2H_2SO_4 + 5H_2O_2 \\ \rightarrow K_2SO_4 + 2MnSO_4 + 8H_2O + 5O_2$$
9. Calculate the ΔG and ΔH of the following cell at 298 K.
- $$H_2(g) | Pt(a.c.) | HCl(aq) || AgCl(s) | Ag(s) | Pt(a.c.)$$

9. (a) State and explain why Debye-Hückel law is used in the measurement of conductance of electrolytic solution. 2
- (b) Derive an expression of pH of an aqueous solution of CH_3COONa . 3
10. Explain the nature of the conductometric titration curve for KCl vs. $AgNO_3$ taken in the titration. 2
11. H^+ and OH^- have abnormal equivalent conductance in water. Explain. 1
10. Write short notes on any four of the following. 2, 2, 2, 2, 2
- ionic product of water
 - Dipole moment
 - Fractional distillation
 - Reference electrode
 - Concentration cell
 - Temperature dependence of equilibrium constant
